

EXPERIMENT 6

DATA VISUALIZATION USING POWER BI

Aim:

To Load the data into PowerBI and transform the data and visualize it to get insights\

Algorithm:

Step 1: Input Data Loading

- Read the dataset from `transactions.csv` containing the columns `Transaction ID`, `Timestamp`, `Sender Name`, `Sender UPI ID`, `Receiver Name`, `Receiver UPI ID`, `Amount (INR)`, and `Status`.
- Load the dataset into Power BI.

Step 2: Status Filter Check

- Add a slicer using the `Status` column.
- Allow the user to select transaction statuses such as SUCCESS and FAILED.
- Filter the transaction data based on the selected status.

Step 3: KPI Total Transaction Amount Calculation

- Calculate the sum of `Amount (INR)` from the filtered transaction data.
- Display the calculated value using a KPI/Card visual.
- The displayed value represents the total transaction amount for the selected status.

Step 4: Bar Chart Calculation – Transaction Amount by Sender

- Group the filtered transaction data according to `Sender Name`.
- Calculate the sum of `Amount (INR)` for each sender.
- Display the results using a Bar Chart.
- Sort the senders based on their total transaction amount.

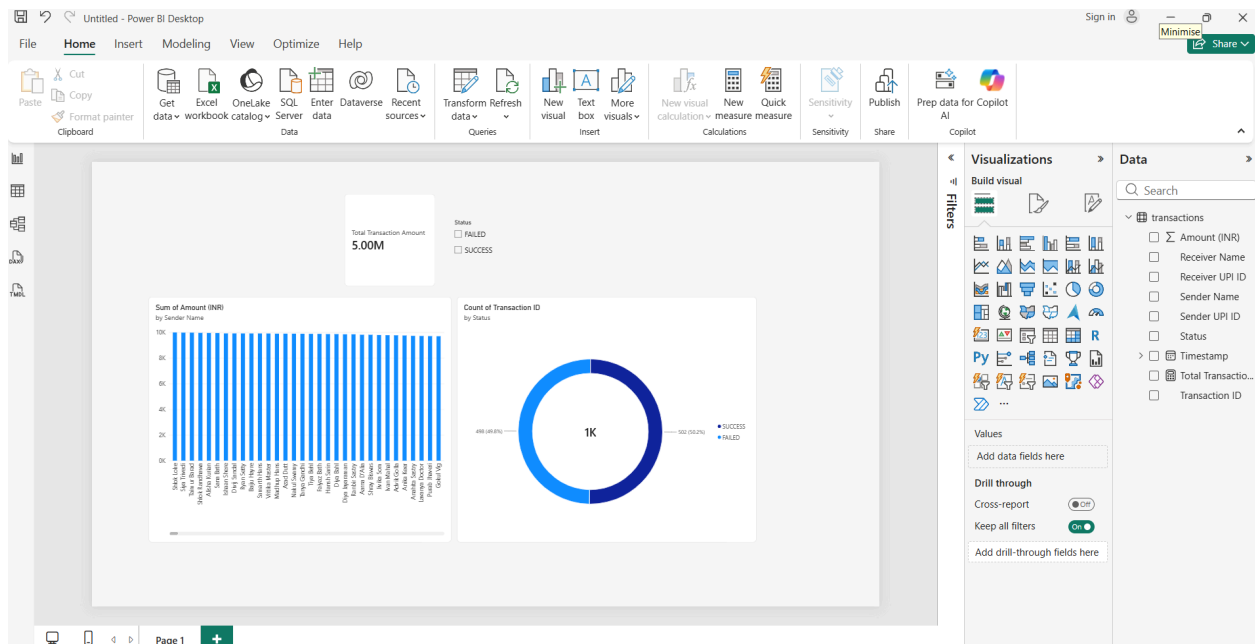

Step 5: Donut Chart Calculation – Transaction Status Distribution

- Group the transaction data according to Status.
- Count the number of transactions for each status.
- Calculate the percentage contribution of each status to the total number of transactions.
- Display the results using a Donut Chart.

Step 6: Dashboard Render

- Render the KPI Card showing the total transaction amount.
- Render the Bar Chart showing transaction amount by sender.
- Render the Donut Chart showing the distribution of transaction statuses.
- Render the Status Slicer for filtering the dashboard.
- When the slicer selection changes, update the KPI, bar chart, and donut chart according to the selected status.

Output:

Result:

Thus, an interactive transaction dashboard was created in Power BI using a Slicer, KPI Card, Bar Chart, and Donut Chart. The dashboard provides an overview of transaction amounts, sender-wise transaction values, and transaction status distribution.
